

CLIENT DEMO

The Demo *Runbook*

A screen-by-screen presenter script for the distributed open-kiln biochar dMRV platform.

Built for a **domain-expert audience**. They know the field — so we never explain the concepts. We open the real screen, point at the real thing, say the line, and move on. The product does the proving.

BEFORE YOU WALK IN

Pre-demo checklist

Sixty seconds of setup buys a flawless demo. Tick every box.

- ☐ **Wake the app.** Open `dmrv-iota.vercel.app` and sign in once — the first request after idle is the slow one. Get it out of the way.
- ☐ **Confirm the demo data.** The registry shows the **Deccan Biochar Cooperative** project, batch **PB-2026-01**, and **36** credits. If you see those, you're loaded.
- ☐ **Start as the Project Developer.** Signed in as `developer@dmrv.demo` (password `RainbowDemo!26`), sitting on the **Dashboard** when the client walks in.
- ☐ **Three photos on the desktop** for the live field capture — name them `pyrolysis`, `flame`, `quench` so you grab them fast.
- ☐ **Second tab parked on Traceability** so the finale is instant.
- ☐ **Browser at ~115%, full-screen, bookmarks hidden.** One-click demo sign-in cards are on `/login` — you'll switch roles from there.
- ☐ **Network check:** load `/registry-public`. Credits visible = you're live.
- ☐ **Know your hero credit:** `RCC-BIO-IN-P001-2026-RMV-000002` — the one a buyer already retired. That's the finale.

THE ARC

The demo at a glance

Nine beats, building to the traceability finale. Know where you are.

- | | | |
|---|--|--|
| 1 Dashboard
the whole operation, live | 2 Field capture
source evidence, offline-first | 3 Review
separation of duties |
| 4 Batch + limits
6-month / 200-tonne meters | 5 Quantification
every input visible | 6 End-use
carbon locked, proven |
| 7 Verification
the audit package | 8 Registry
serials + buffer + two-person | 9 Traceability
the mic-drop finale |

The step-by-step script

Scan the labels while you talk. The **[SAY]** block is your line — say it, then move.

1 Cold open — the whole operation, live

BEAT 1 · DASHBOARD

OPEN

Logged in as **Project Developer** — you land on the **Dashboard** (the default screen).

SHOW

The **KPI strip** across the top, and the **Sites & operations** map beneath it.

““ SAY

This is the entire cooperative in one view — every site, every kiln, every credit, read straight off the operational records.

POINT OUT

The four tiles: **Net CO₂ removed 36.4 tCO₂e**, **RCCs issued**, **Biochar produced 18.6 t**, **Buffer pool**. On the right, open-batch meters already tracking the caps.

IF ASKED

"*Is this live?*" → "One data layer. Every tile is a query against the same records an auditor sees — no separate reporting."

NEXT

Top-right avatar → **Sign out**, to switch into the field as the operator. →

2 The field capture — evidence at the source

BEAT 2 · FIELD LOG

OPEN

On **/login**, click the **Kiln Operator** card. Sidebar → **Field log**.

SHOW

The **Kiln run** form, and the **Required evidence** card with its three photo slots.

““ SAY

This is where it starts. Three photos are mandatory — clean pyrolysis, flame curtain, quench. No photos, no submission.

POINT OUT

The right rail: **Connection** (Online/Offline), **GPS** auto-captured, **Photos 0/3**. It's offline-first — runs queue on the device and sync when signal returns.

IF ASKED

"*No signal in the field?*" → point at the Connection badge: "Captured locally, synced automatically. Nothing lost."

NEXT

Add the three desktop photos → **Submit for review**. Then **Sign out** → back in as **Project Developer**. →

3 Review & sign-off — the separation is real

BEAT 3 · REVIEW QUEUE

OPEN Signed in as **Project Developer**. Sidebar → **Review queue**.

SHOW The queue of submitted runs awaiting sign-off.

“ **SAY**

The operator submits; someone else signs off. Producers and reviewers are separated — enforced in the database, not just hidden in the UI.

POINT OUT **Approve / request changes / reject**, each with a comment. An operator cannot approve their own run — the row simply isn't actionable for them.

IF ASKED "Can an operator edit after approval?" → "No. Approved records lock; corrections are appended, never overwritten."

NEXT Sidebar → **Production batches**. →

4 The batch — and the limits the app enforces

BEAT 4 · BATCHES

OPEN **Production batches** list, then open **PB-2026-01**.

SHOW The **Tonnage** and **Age** meters, then the **composite sampling chain** on the batch.

“ **SAY**

Approved runs roll into a batch. Two live meters — tonnes toward 200, age toward six months. Amber near the cap, red past it. Whichever comes first.

POINT OUT **PB-2026-01**: 24 runs, 18.6 t dry, and the sampling chain — site pile → site sample → batch sample → accredited lab.

IF ASKED "What happens at the limit?" → "The batch stops taking runs and prompts closure. The rule holds itself."

NEXT Sidebar → **GHG quantification**. →

5 The quantification — every input visible

BEAT 5 · GHG

OPEN

GHG quantification → the **Live GHG calculator**. Select batch **PB-2026-01** (it prefills the lab values).

SHOW

The **breakdown panel** on the right and the running **Net CO₂ removed** figure.

“ SAY

Comparative LCA, ISO 14064-2. Not a number to trust — the whole equation, line by line, replayable by a VVB.

POINT OUT

Dry mass → permanence from **H/C 0.42** and soil temp → gross removal → minus baseline, project, transport → uncertainty → net. This batch's verified figure: **36.4 tCO₂e**.

IF ASKED

"*What enforces permanence?*" → change **H/C** to **0.80**: the badge flips to **Ineligible** instantly. "The 0.7 threshold is live in the math." Then set it back to 0.42.

NEXT

Sidebar → **End-use**. →

6 Carbon locked — the end-use record

BEAT 6 · END-USE

OPEN

Sidebar → **End-use**.

SHOW

The **map** of application points and the **proof photos** attached to each record.

“ SAY

The end-use point — biochar leaves the producer and goes into the soil. Quantity, method, recipient, GPS, photos. All on the record.

POINT OUT

Four recipient groups, GPS-tagged, proof attached. This is where the carbon is durably stored — and it's evidenced, not asserted.

IF ASKED

"*Proof of end use?*" → click a proof photo: the location and recipient are right there on it.

NEXT

Sign out → sign in as **Verifier**. Sidebar → **Verification**. →

7 The verification package

BEAT 7 · VERIFICATION

OPEN Signed in as **Verifier. Verification** → open the **PB-2026-01** package.

SHOW The single-screen package: **Batch**, **GHG quantification**, **Laboratory results**, **Evidence chain** counts, **Findings**.

“ **SAY**

The verifier reads the whole evidence chain here — and can raise findings, but cannot alter a single source record. Independence, enforced.

POINT OUT Evidence chain: **24 runs** · **72 run photos** · **1 lab test**. The H/C eligibility badge. Two findings raised and resolved. Then — **Print package**, top-right.

IF ASKED "Can she change the numbers?" → "Read-only on the evidence. She approves or rejects; she never edits."

NEXT **Sign out** → sign in as **Registry Admin**. Sidebar → **Carbon credits**. →

8 Registry & issuance

BEAT 8 · REGISTRY

OPEN Signed in as **Registry Admin**, on the **Rainbow registry**.

SHOW The **Issuances** table, then the **Credit ledger** and the **Serial number format** legend.

“ **SAY**

Verified and quantified — now it's credits. Two-person control: one admin initiates, a different one approves. You can't approve your own issuance.

POINT OUT PB-2026-01 issuance — **Gross 36** · **Buffer 1** · **Net 35**. The buffer took its 2% automatically. Every credit serialised: **RCC-BIO-IN-P001-2026-RMV** — project, geography, vintage, mechanism, all encoded.

IF ASKED "Double-counting?" → "Every serial is unique and retire/transfer-tracked. A retired credit can never be reissued."

NEXT Sidebar → **Traceability**. This is the finale. →

9 The finale — trace it back to the flame

BEAT 9 · TRACEABILITY

OPEN

Traceability. In the **credit** selector, pick **RCC-BIO-IN-P001-2026-RMV-000002** — retired to **EcoCorp Net-Zero Programme 2026**.

SHOW

The numbered chain builds down the page: credit → issuance → verification → GHG → lab → batch → runs → feedstock → **Field evidence**.

“ SAY

Here's the one that matters. A credit a buyer has already retired against their net-zero target — watch me walk it back.

POINT OUT

Scroll to the **Field evidence** step and **click one photo** — the kiln burn that produced it, with the **GPS and timestamp** still on it.

“ SAY — LAND IT

From a credit on a corporate balance sheet, back to the photograph of the kiln, GPS and timestamp attached — in about ten seconds. Every credit you sell, defensible down to the flame.

IF ASKED

"Does it run forward too?" → click **Trace something else**, pick a **feedstock delivery** → forward to the credits it produced.

NEXT

One short line on where we go next, then close. →

10 The roadmap beat — brief, and honest

FORWARD-LOOKING

SHOW

Stay on screen. This is spoken, not clicked — say it and stop.

“ SAY

Everything you saw is live today. Next, together: the system reads a lab PDF and pre-fills the carbon values for your reviewer to confirm, and flags any photo that doesn't look like a genuine run for a human to check. AI-assisted, human-confirmed — it makes the credits more defensible, never less.

POINT OUT

Say the word **roadmap** out loud. One line, then move to the close. Never demo an unbuilt feature.

NEXT

Close. →

If something won't load

- Stay calm — a live demo hiccup is normal, and composure reads as confidence.
- Fall back to a screenshot of that screen, or open a neighbouring record ([/runs](#), [/registry](#)) that's already cached.
- Never improvise an unbuilt feature to fill the gap. If it's not on screen, it's roadmap — say so.

"The joy of a live system — one honest second while it loads. While it does, here's what you're about to see..."

"Let me show you the same thing from a record that's already open."

"I'll send a short screen recording of that exact flow right after this."

THE CLOSE

Closing — the exact final lines

Deliver these, then stop talking and let them respond.

"You just watched one credit go from a flame in a field to a buyer's balance sheet — and come all the way back, defensible at every step. That's the platform, live today, with an AI roadmap that only makes it more defensible."

The ask — leave them with three moves

1. **A pilot on your data** — your sites, kilns, and team in the system within a couple of weeks, so you're clicking your own records.
2. **Bring your VVB into a session** — let them try to break the evidence chain. That's the best sales call we can have.
3. **A short proposal** scoped to your credit volume, in your inbox this week.

"Can we get the pilot on the calendar?"

The 5-minute version

Four screens: Dashboard → Field → Issuance → Traceability. Cut everything else.

- 1 Dashboard** (Project Developer). *"The whole cooperative in one view, straight off the operational records."* Point at the KPI strip and the map. ~45s.
- 2 Field log** (Kiln Operator). *"Mandatory pyrolysis, flame-curtain and quench photos, auto-GPS, offline-first — and he can't approve his own run."* Point at Required evidence + the Connection/GPS rail. ~75s.
- 3 Carbon credits** (Registry). *"Two-person issuance, automatic 2% buffer, every credit serialised and retire-tracked."* Point at Gross 36 · Buffer 1 · Net 35 and the serial legend. ~60s.
- 4 Traceability** — pick retired credit *...-000002* → scroll to **Field evidence** → click the kiln photo. *"From a retired credit back to the flame, GPS and timestamp attached, in ten seconds. That's the integrity buyers demand — live today."* ~75s. This is the close.
